

Need a script which displays a booking calendar for holiday accommodation based on google - calendar.

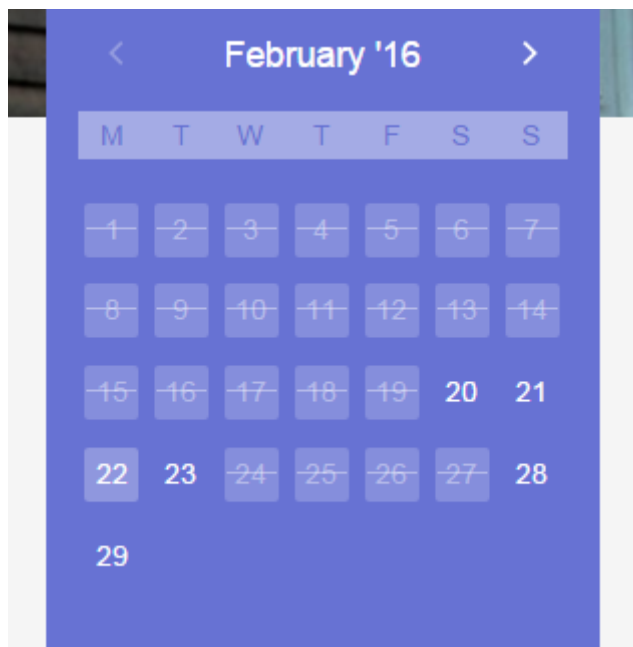

The script should read the public google calendar .ical and translate it to a own designed view on my website.

Calendar .ical can be connected via google calendar > settings > calendar > details > calendar address > .ical

I need two views, each view displayed separate

1th view

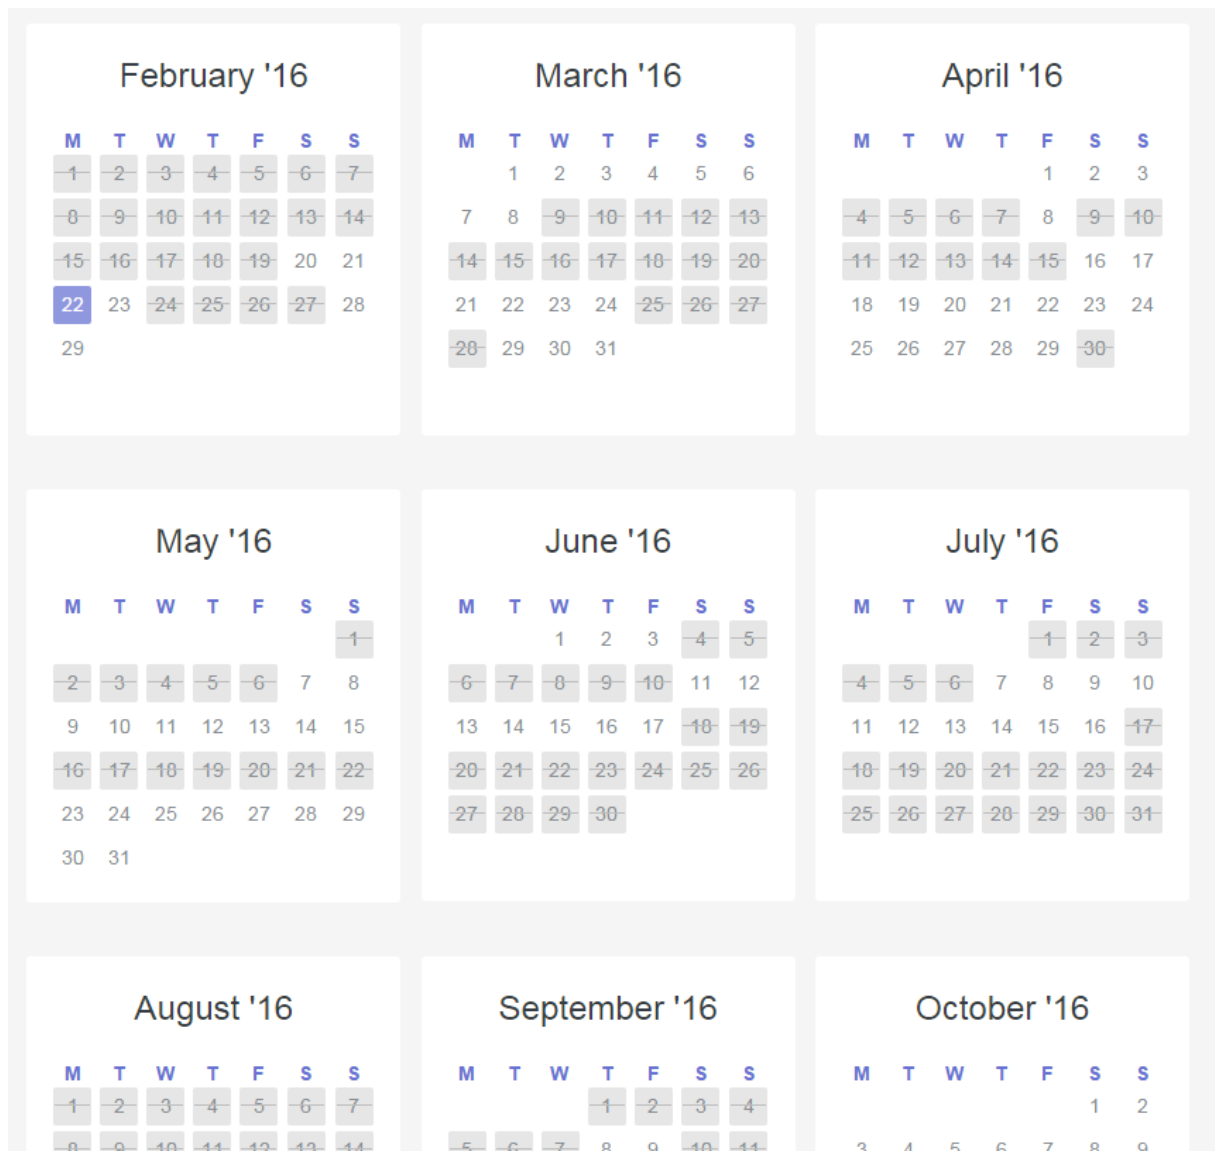

- only one month should be displayed
- automatically display the current month
- the current day need a extra style to show which day is today
- directions icons to navigate forward and backwards in month
- new visible month should also display the reserved/blocked days
- the reserved days should get his extra style to show what's blocked
- first day and last day need extra styles (start and end)

2nd

- a display of the current month and the next 8 or 11 months
- each month comes with his days
- blocked days should need a extra style

--- start and end dates as well

customizable:

- define the calendar address (.ical-URL)
- set start day of week
- changeable length of weekday
- changeable language of weekdays and month (moments.js)
- all css can be replaced/changed by separated css-file

languages:

- JS
- JQuery

- angularJS
- json
- twitter bootstrap

some hints:

- moment.js <http://momentjs.com/>
